

DICOM – File size, Compression, General Information

Information

This article contains general information about file size, compression types etc.

File size

Standard TTFM image will be approximately 240kb.

US will vary depending on the length of the recording. A simple 5 sec recording is approximately 70-80 Mb.

The variation in size is depending on the length of the recording, compression and if “Include raw data as private tags” is selected. The TTFM videos will, if compressed, be smaller in size as they contain more white sections that can be compressed more than a US image. If “Include raw data as private tags” is selected will the size vary considerable for US imaging data, in example if Colour mode is selected, debt settings, frame rate etc.
